

Computacenter – Device Lifecycle Management Pre-Sales Delivery

The Device Lifecycle Management solution enables organisations to take control and optimise their workplace device estate through a structured, end-to-end process: Inform, Procure, Support, and Recover.

As part of the Pre-Sales Team, I lead the commercial and technical shaping of this solution — from initial tender response through to final contract negotiation and Statement of Work (SoW) creation.

Bid Response & Tender Stage

When a client issues a Request for Proposal (RFP) or Invitation to Tender (ITT), I coordinate the full bid response process.

This includes analysing requirements, aligning Computacenter’s lifecycle capabilities, and developing a compliant, compelling proposal that demonstrates value, scalability, and sustainability.

- Requirement analysis and clarification
- Solution alignment with Inform, Procure, Support, Recover lifecycle model
- Drafting technical and commercial narratives
- Coordinating input from technical SMEs, service architects, and commercial analysts
- Ensuring compliance with client evaluation criteria and governance frameworks

The goal is to present a solution that not only meets the specification but also differentiates Computacenter through innovation, efficiency, and proven delivery capability.

Down-Selection & Solution Shaping

Once shortlisted, I work directly with the client's technical and commercial teams to refine the proposal.

This stage involves collaboration across multiple internal departments — including Managed Services, Technical Architecture, Logistics, and Legal — to shape the final solution and cost model.

- Technical workshops to validate architecture and service design
- Engagement with logistics teams to define deployment and recovery processes
- Collaboration with Managed Services to align support models and SLAs
- Legal review of contractual terms, liabilities, and compliance obligations
- Cost modelling and resource planning to ensure commercial viability

This iterative process ensures the proposed solution is deliverable, scalable, and aligned to both client expectations and Computacenter's operational standards.

Negotiation & BAFO Stage

Following solution validation, I lead the commercial negotiation phase, culminating in the Best and Final Offer (BAFO) submission.

This stage balances client value with delivery feasibility, ensuring both parties achieve a sustainable and mutually beneficial agreement.

- Refinement of pricing models and delivery phasing
- Risk assessment and mitigation planning
- Negotiation of commercial concessions and value-adds
- Presentation of final proposal and cost justification
- Agreement of final Statement of Work (SoW) and contract pricing

The outcome is a fully validated, contract-ready solution — technically robust, commercially sound, and operationally deliverable.

Strategic Impact

Through this structured pre-sales approach, I ensure Computacenter's Device Lifecycle Management solutions are positioned for success — combining technical excellence, commercial discipline, and collaborative engagement.

Each bid transforms from a tender response into a fully governed, client-approved delivery model that optimises workplace technology, enhances user experience, and supports sustainable IT operations.
