

## **AdminRe / Swiss Re – Aviva Book of Business Migration to Alpha Platform**

AdminRe / Swiss Re (formerly Windsor Life) embarked on a multi-year, large-scale transformation programme to transfer the Aviva book of business into its in-house “Alpha” life and pensions platform.

This complex initiative combined legacy system integration, software development, and extensive data migration — all underpinned by a disciplined Agile release framework.

### **Programme Overview**

The programme represented one of the most intricate migrations within the UK life and pensions sector.

It required synchronised delivery across multiple technology stacks, contractual milestones, and financial dependencies with Aviva.

*Scope included:*

- Software development for new functionality in COBOL and VB
- Ancillary application development in Alchemy and Unix
- Large-scale data migration from Aviva systems to Alpha
- Monthly Agile releases tied to contractual financial obligations

This approach ensured continuous progress visibility, iterative delivery, and compliance with stringent regulatory and commercial requirements.

### **Agile Release Approach**

The programme adopted a monthly release cadence, combining iterative development with structured data-migration cycles.

Each release was aligned to contractual milestones, ensuring traceability between technical delivery and financial obligations.

*Key features:*

- Incremental functionality deployment
- Parallel data-migration validation
- Continuous integration and regression testing
- Stakeholder review and release sign-off

This rhythm maintained delivery momentum while enabling early identification and resolution of technical and data-related issues.

### **Development Lifecycle Management**

I was responsible for the end-to-end management of the development lifecycle, ensuring quality, traceability, and alignment with programme objectives.

*Responsibilities included:*

- Functional specification creation
- Test plan development and execution oversight
- Unit, system, integration, UAT, and regression testing coordination
- Defect management and release governance
- Detailed planning and dependency tracking
- Resource allocation and workload balancing
- Priority management across concurrent workstreams

This structured approach ensured consistent delivery quality and adherence to both technical and contractual timelines.

 **Technical Delivery Highlights**

- COBOL & VB Development: Enhancements to Alpha platform functionality for policy administration and financial processing
- Alchemy & Unix Applications: Supporting data transformation and operational automation
- Data Migration: High-volume transfer of policy, customer, and financial data with full reconciliation and audit trails
- Testing Frameworks: Multi-layered validation ensuring data integrity and functional accuracy

 **Outcomes**

- Successful migration of Aviva's book of business into the Alpha platform
- Improved operational efficiency and data integrity
- Enhanced system functionality supporting future scalability
- Strengthened collaboration between AdminRe / Swiss Re and Aviva through transparent delivery governance

### **Strategic Impact**

The programme delivered a robust, compliant, and scalable life & pensions platform, enabling AdminRe / Swiss Re to consolidate operations and enhance service delivery.

It stands as a benchmark for complex financial-system migrations executed through disciplined Agile governance and meticulous lifecycle management.
