

Case Study: The Home Office – Secure IT Infrastructure Transformation

Overview

We partnered with the Home Office to deliver a complete redesign, build and implementation of a new outsourced IT infrastructure platform. The programme modernised the Home Office's technology estate by introducing a secure public-sector cloud environment, a fully managed device ecosystem, and integrated access to critical business applications across a nationwide secure WAN.

This case study outlines the challenge, the approach, and the measurable outcomes achieved.

The Challenge

The Home Office required a modern, secure, scalable IT platform capable of supporting diverse operational needs across multiple sites. The legacy environment suffered from:

- Fragmented infrastructure and inconsistent security controls
- Ageing devices with limited remote-working capability
- Siloed application access across partner organisations
- Increasing pressure to meet stringent public-sector security standards
- A need for unified management across desktops, laptops, tablets and handheld devices

The organisation needed a complete technology refresh, delivered within a secure cloud service and capable of supporting thousands of users across a protected national WAN.

Programme Mandate

We were commissioned to:

- Design, build and implement a new outsourced IT infrastructure platform
- Deliver the solution within a secure public-sector cloud environment
- Provide end-to-end secure services across all sites in scope
- Integrate access to critical business applications supplied by multiple delivery partners
- Ensure full compliance with government security and operational standards

This required a multi-partner delivery model, strong governance, and a robust technical architecture.

1. Platform Design & Architecture

We engineered a secure cloud-based platform that became the foundation for all services delivered across the estate. Key architectural components included:

- Secure Public-Sector Cloud Hosting – resilient, compliant, and scalable
- Unified Device Ecosystem – desktops, laptops, tablets, handheld devices
- Secure WAN Connectivity – encrypted links across all operational sites
- Centralised Identity & Access Management – consistent authentication and policy enforcement
- Interoperability Framework – enabling seamless access to partner-provided applications

The architecture ensured security, performance, and future scalability.

2. Secure Digital Services Delivered

Across the secured WAN, we deployed a suite of fully managed services:

- Secure Email Services – protected communication across departments and partners
- Remote Access Capability – enabling flexible, policy-driven working

- Mobile Device Management (MDM) – full lifecycle control of mobile endpoints
- Managed & Hosted Device Services – provisioning, patching, compliance and support
- Application Access Integration – secure connectivity to critical business systems delivered by our partners

These services were unified under a single governance and operational model.

3. Multi-Partner Delivery Model

The programme required coordinated delivery across multiple organisations. We led:

- Architectural governance
- Security assurance
- Infrastructure build and deployment
- Device rollout and management
- Integration with partner-provided applications
- Testing, transition and service onboarding

This collaborative approach ensured consistent standards and a seamless user experience.

Key Outcomes

- Modern, secure cloud platform replacing legacy infrastructure
- Unified device estate supporting desktops through to handheld devices
- Consistent security posture across all sites and all user groups
- Improved operational resilience through cloud-based hosting
- Enhanced mobility via secure remote access and MDM
- Integrated access to critical business applications from multiple partners
- Future-ready architecture capable of scaling with Home Office needs

The programme delivered a robust, secure and flexible IT environment that strengthened the Home Office's operational capability and supported its national responsibilities.
