

United Utilities – Intune, Autopilot & Windows 11 Global Deployment with Azure Build

United Utilities embarked on a major enterprise-modernisation programme to deliver a Windows 11 global deployment supported by Microsoft Intune, Autopilot, and a new Azure infrastructure build.

The initiative aimed to transform endpoint management, enhance security, and enable a cloud-connected workplace across the organisation's geographically distributed operations.

Programme Overview

The programme was designed to modernise United Utilities' end-user computing environment, streamline device provisioning, and strengthen compliance through cloud-based management.

It unified device lifecycle management under Intune and Autopilot, while Azure provided the foundation for scalable identity, security, and automation.

Objectives:

- Deploy Windows 11 across all corporate and field devices
- Implement Intune for unified endpoint management
- Configure Autopilot for zero-touch device provisioning
- Build and optimise Azure infrastructure for identity and policy control
- Enhance security posture through conditional access and compliance baselines

Delivery Approach

The rollout followed a phased, Agile delivery model, combining infrastructure build, pilot validation, and global deployment waves.

Phase 1 – Azure Build & Configuration

- Designed and deployed Azure Active Directory architecture
- Implemented conditional access, MFA, and compliance policies
- Integrated Azure with existing on-premises identity systems
- Established automation scripts for device enrolment and policy assignment

Phase 2 – Intune & Autopilot Implementation

- Configured Intune for device management, patching, and compliance enforcement
- Developed Autopilot profiles for seamless provisioning and user setup
- Created standardised configuration templates for different business units
- Conducted pilot deployments to validate performance and compatibility

Phase 3 – Windows 11 Global Deployment

- Executed rollout waves across corporate offices and field sites
- Managed logistics for device refresh and migration sequencing
- Delivered multilingual training and adoption materials
- Monitored rollout progress through Power BI dashboards and Azure analytics

Security & Compliance

Security was central to the programme design, aligning with United Utilities' regulatory and operational standards.

Key measures:

- Zero Trust architecture implementation
- Endpoint encryption and TPM 2.0 enablement
- Automated compliance reporting via Intune and Azure AD
- Integration with Defender for Endpoint and ServiceNow for incident tracking

Outcomes

- Successful Windows 11 deployment across all global sites
- Unified endpoint management through Intune and Autopilot
- Enhanced security and compliance aligned with Zero Trust principles
- Reduced provisioning time and operational overhead
- Scalable Azure foundation supporting future digital-workplace initiatives

Strategic Impact

The programme delivered a secure, cloud-connected, and future-ready workplace for United Utilities.

By leveraging Azure, Intune, and Autopilot, the organisation achieved a modern desktop environment that improved agility, resilience, and user experience across its global operations.
