

Delivering Synchrony's Global Managed Services Transition & Transformation

A 2-Year Delivery Programme Within a 5-Year Financial Services Managed Services Contract

Synchrony, a leading organisation in the financial services sector, embarked on a multi-tower transformation to modernise its global IT operations, strengthen service resilience, and elevate user experience across its enterprise. Over a 2-year delivery window, I led the full transition from the incumbent MSP to a new, integrated global managed services model — executed through incremental service go-lives to ensure stability, compliance, and zero disruption to business-critical financial operations.

The programme underpinned a 5-year managed services contract, establishing a long-term operational foundation capable of supporting 125,000 users across the US, India, and the Philippines.

Global Service Operations Built for Financial Services Scale

Synchrony required a service model capable of supporting high-volume, regulated financial operations across multiple time zones. I delivered:

- A 24/7 Global Service Desk operating across three continents

- A unified ServiceNow ITSM platform covering incident, request, change, problem, and major incident management
- Modernised telephony and contact-centre systems aligned to financial-sector compliance and auditability

These capabilities created a single, predictable operational rhythm — essential for a financial services organisation where service availability directly impacts customer trust and regulatory obligations.

Incremental Service Go-Lives: Controlled, Predictable, Zero-Disruption

The 2-year delivery programme was structured around phased service activation, ensuring each tower transitioned safely and predictably:

- Early towers (Service Desk, Telephony, ITSM) stabilised first
- Infrastructure towers (Networking, Wintel, Security) followed with controlled cutovers
- High-risk components (Data Centre Migration, Supply Chain, Device Refresh) were sequenced to minimise operational exposure

This incremental approach ensured uninterrupted service for Synchrony's financial operations, reduced early-life incidents, and enabled continuous learning between phases.

Digital Experience & Automation for a Modern Workforce

To modernise user engagement and reduce operational load, the programme introduced:

- A multilingual enterprise chatbot supporting English and Mandarin, enabling self-service for common requests
- Automated ServiceNow workflows improving SLA adherence, routing accuracy, and audit traceability
- Enhanced user-adoption programmes ensuring employees understood new tools, processes, and support channels

These changes shifted Synchrony from reactive support to proactive, user-centred digital service delivery.

End-User Technology & Supply Chain Modernisation

Synchrony's workforce required modern, secure, and reliable devices to support productivity across financial operations. I led:

- A global device refresh programme with standardised builds and secure configurations
- A redesigned supply chain model ensuring predictable fulfilment, asset tracking, and lifecycle management
- Structured user adoption and communication plans to support smooth transitions

This delivered measurable improvements in user satisfaction, device performance, and operational stability.

Infrastructure & Platform Transformation

The programme delivered significant uplift across core infrastructure towers:

- Data centre migration from legacy environments to modern, secure platforms
- Transformation of Networking, Wintel, and Security services to align with financial-sector resilience and compliance standards
- Integration of new MSP capabilities into Synchrony's enterprise architecture

These changes strengthened Synchrony's technical backbone and positioned the organisation for future cloud and digital transformation.

ITSM Excellence & Governance for Regulated Environments

Financial services demand disciplined governance and mature ITSM practices. I established:

- End-to-end Incident, Request, Change, Problem, and Major Incident Management
- A unified service catalogue, operational playbooks, and acceptance criteria for all towers
- A structured transition framework ensuring predictable handover into BAU

This ensured stability, clarity, and accountability across the entire MSP ecosystem.

Outcome: A Modern, Resilient, Financial-Grade Global Service Model

By the end of the 2-year delivery programme, Synchrony had

- A fully integrated global managed services model
- Modernised infrastructure and end-user technology
- A unified ITSM platform with automation at its core
- A multilingual digital support experience
- Strengthened operational resilience and reduced early-life incidents
- A scalable foundation for the remaining 5-year managed services term

This was not simply a supplier transition — it was a full operational uplift, delivering a modern service landscape capable of supporting Synchrony's financial services operations for years to come.
