

London Luton Airport – MFA, PAM, SSO & Cyber Security Programme

As PMO Manager, I led the governance and delivery of the Cyber Security Transformation Programme at London Luton Airport, covering Multi-Factor Authentication (MFA), Privileged Access Management (PAM), Single Sign-On (SSO), and associated cyber-security enhancements.

The initiative strengthened identity protection, access control, and compliance across the airport's enterprise environment through a structured Discovery, Assessment, Design, and Configuration lifecycle.

Discovery & Assessment

The programme began with a comprehensive discovery phase to evaluate existing identity and access-management practices across operational and corporate systems.

Key activities:

- Audit of current authentication and access-control mechanisms
- Identification of privileged accounts and legacy access dependencies
- Risk assessment of critical systems and user roles
- Gap analysis against NCSC and ISO 27001 standards
- Stakeholder workshops with IT, operations, and security teams

This assessment provided a clear baseline for designing a secure, scalable identity-management architecture.

Design Phase

The design phase focused on defining the target architecture and integration model for MFA, PAM, and SSO solutions.

Deliverables:

- MFA architecture leveraging Azure AD and conditional-access policies
- PAM design incorporating secure vaulting, session recording, and least-privilege principles
- SSO framework enabling seamless authentication across enterprise applications
- Integration blueprint for legacy systems and airport-specific operational platforms
- Security-policy alignment with GDPR and aviation-sector compliance standards

The design ensured interoperability between cloud and on-premises systems while maintaining strong governance controls.

Configuration & Implementation

Following design approval, the configuration phase delivered technical deployment and operational readiness.

Key configuration activities:

- MFA rollout across corporate and operational user groups
- PAM solution configuration for privileged account management and audit logging
- SSO integration with critical business applications and airport systems
- Security hardening of identity infrastructure and access gateways
- User-acceptance testing and phased go-live across departments

The implementation achieved full coverage across the airport's IT estate, enhancing resilience and user experience.

Governance & Assurance

I established PMO governance to ensure delivery discipline, compliance, and stakeholder alignment throughout the programme.

Responsibilities:

- Programme planning and milestone tracking
- Risk and issue management across technical streams
- Vendor coordination and assurance reviews
- Reporting to senior airport leadership and cyber-security steering group
- Continuous improvement of delivery processes and documentation

This governance framework ensured transparency, accountability, and consistent delivery quality.

Outcomes & Impact

- Strengthened identity and access-management posture
- Enhanced protection of privileged accounts and critical systems
- Streamlined authentication through SSO and MFA adoption
- Improved compliance with aviation and data-protection standards

- Established foundation for future Zero-Trust architecture initiatives

Strategic Contribution

The programme delivered a secure, integrated, and compliant identity-management ecosystem for London Luton Airport.

By combining MFA, PAM, and SSO under a unified cyber-security framework, the airport achieved a resilient foundation for operational continuity and digital transformation.
