

Upgrading 32,000 Home Office devices to Windows 10

How a multi-phase migration modernised the desktop, strengthened security and brought cloud-based management to a national estate.

Client	Devices	Upgrade	Management
UK Home Office	32,000 endpoints	Windows 7/8 to Windows 10	SCCM, Intune, Azure

Overview

The UK Home Office ran a major end-user technology transformation, upgrading 32,000 devices across its national estate to Windows 10.

The programme modernised the department's desktop environment, strengthened security, and introduced cloud-based management and storage capabilities through SCCM, Intune and Azure integration.

The approach

The transformation was delivered in a structured, multi-phase way. This kept disruption to critical Home Office operations to a minimum while maintaining compliance with government security standards.

Along the way the initiative unified device management, improved performance and enabled secure remote working across multiple agencies.

What was delivered

Device upgrade	Migrated 32,000 endpoints from legacy Windows 7/8 to Windows 10, ensuring compatibility with modern applications and security baselines.
SCCM and Intune integration	Implemented a hybrid management architecture for automated deployment, patching and compliance enforcement.
Cloud storage enablement	Introduced secure OneDrive and Azure-based storage, reducing reliance on on-premises infrastructure.
Identity and access management	Strengthened authentication and policy enforcement through Azure AD and conditional access.
Operational tooling	Enhanced service management tooling for incident, request and change processes.
User adoption and training	Delivered communication campaigns, training sessions and early-life support for a smooth transition.
Governance and reporting	Established dashboards for rollout progress, compliance and user satisfaction.

Security and compliance

Windows 10's security framework was mapped directly to Home Office risk and compliance standards, ensuring alignment with public-sector security classifications.

The rollout introduced TPM 2.0, BitLocker encryption and advanced identity management, strengthening endpoint protection across all operational sites.

Outcomes

- A modernised desktop experience for 32,000 users.
- Improved endpoint security and compliance posture.
- Reduced operational overhead through automation and cloud management.
- Enhanced mobility and remote-work capability.
- A scalable foundation for future digital-workplace initiatives.

Strategic impact

The Windows 10 transformation positioned the Home Office to deliver a consistent, secure and high-performance user experience across its national operations.

It reinforced the department's commitment to innovation, resilience and digital transformation, helping staff work smarter, faster and more securely.
