

ServiceNow Development & Integration – Public and Private Sector Delivery

A professional overview of bi-directional ITSM integration, platform development, and enterprise service management delivery.

Programme Overview

As Transition Manager, I led and coordinated numerous ServiceNow development and integration projects across both public and private sector clients. These initiatives focused on extending ServiceNow's capabilities through bi-directional integration and data mapping with existing ITSM platforms, enabling unified service management, improved automation, and enhanced reporting across complex enterprise environments.

Scalable Implementations

Deliver scalable ServiceNow implementations for diverse client environments

Legacy Integration

Integrate legacy ITSM platforms through bi-directional data exchange

Process Standardisation

Standardise service-management processes across multi-vendor ecosystems

Unified Governance

Enhance visibility, automation, and governance through unified dashboards

Technical Scope

1 ServiceNow Platform Development
Custom modules, workflows, and automation scripts

2 Bi-Directional Integration
Real-time data exchange between ServiceNow and legacy ITSM tools (e.g., Remedy, Cherwell, Ivanti)

3 Data Mapping & Transformation
Schema alignment for incidents, requests, changes, and configuration items

4 API and Middleware Design
Secure REST and SOAP integrations ensuring data integrity

5 CMDB Synchronisation
Automated updates across configuration repositories

6 Reporting and Analytics
Unified dashboards for SLA, KPI, and operational metrics

Integration Architecture

The integration architecture was designed to ensure seamless interoperability between ServiceNow and existing ITSM ecosystems.

Governance & Delivery Approach

Framework Alignment

Governance was maintained through structured PMO oversight, ensuring alignment with ITIL and ISO 27001 standards throughout every phase of delivery.

Delivery Lifecycle

01

Discovery

Requirements workshops with client stakeholders

02

Design

Integration blueprints and data-flow diagrams

03

Development

Managed sprints and configuration cycles

04

Testing

Validation and user-acceptance phases

05

Handover

Documentation, training, and operational handover

Stakeholder Collaboration

I worked closely with multiple teams to ensure technical precision, stakeholder confidence, and smooth adoption across diverse environments:

Platform Owners

Client ITSM and ServiceNow platform owners

Technical Teams

Solution architects and integration engineers

Security & Compliance

Security and compliance teams

Vendor Partners

Vendor partners and managed-service providers

Outcomes & Impact

Successful Delivery

ServiceNow integrations delivered successfully across multiple clients

Real-Time Sync

Real-time synchronisation between ServiceNow and legacy ITSM platforms

Operational Visibility

Improved operational visibility and SLA tracking

Reduced Manual Effort

Reduced manual effort through automated data exchange

Enhanced Governance

Enhanced governance and auditability across service-management processes

Strategic Contribution

These projects collectively advanced clients' digital-service-management maturity, enabling unified ITSM ecosystems and data-driven decision-making. By integrating ServiceNow with existing platforms, organisations achieved greater efficiency, transparency, and scalability in their service-delivery operations.

Efficiency

Streamlined service delivery through automation and unified platforms

Transparency

Data-driven decision-making enabled by consolidated reporting

Scalability

Architectures designed to grow with evolving enterprise needs
