

Unipart Server and Application virtualisation

As PMO Manager supporting Unipart's enterprise technology transformation, I oversaw the Server and Application Virtualisation Programme, designed to modernise datacentre operations, optimise resource utilisation, and enhance application delivery across the organisation's global infrastructure.

The initiative unified multiple virtualisation technologies — Hyper-V, App-V, Citrix Presentation Server, VMware, and NetScaler — under a cohesive architecture, enabling scalable, secure, and efficient service delivery.

Programme Overview

The programme aimed to consolidate Unipart's physical server estate and streamline application deployment through virtualisation and centralised management.

Objectives:

- Migrate legacy datacentre servers to virtualised platforms (P2V)
- Implement Hyper-V and VMware for server virtualisation
- Deploy App-V for dynamic application streaming and isolation
- Integrate Citrix Presentation Server for centralised application access
- Configure NetScaler for secure load balancing and remote connectivity

This transformation reduced hardware footprint, improved resilience, and accelerated application delivery across business units.

Technical Implementation

Hyper-V & VMware Virtualisation

- Designed and deployed Hyper-V clusters for Windows-based workloads
- Integrated VMware ESXi environments for cross-platform compatibility
- Established high-availability configurations and failover clustering
- Delivered P2V migrations for legacy datacentre servers

App-V & Citrix Presentation Server

- Implemented Microsoft App-V for virtual application packaging and delivery
- Streamlined application lifecycle management and patching
- Deployed Citrix Presentation Server for secure, centralised application access
- Enhanced user experience through optimised session management

NetScaler Integration

- Configured NetScaler gateways for secure remote access and load balancing
- Improved application performance and network efficiency
- Enabled SSL offloading and traffic optimisation across virtual environments

Governance & Assurance

I established PMO governance to ensure delivery discipline, risk control, and alignment with Unipart's IT strategy.

Key responsibilities:

- Programme planning and milestone tracking
- Vendor coordination and technical assurance
- SLA management and performance reporting
- Risk, issue, and dependency management across virtualisation streams

This governance framework ensured predictable delivery and operational stability throughout the transformation.

Stakeholder & Team Management

I led cross-functional teams comprising infrastructure engineers, application specialists, and project managers, ensuring seamless collaboration across technology domains.

Stakeholder groups:

- Infrastructure and operations teams
- Application owners and business units
- Vendor partners (Microsoft, Citrix, VMware)
- Senior IT leadership

Through structured communication and transparent reporting, I maintained alignment between technical execution and strategic objectives.

Outcomes & Benefits

- Successful migration of datacentre servers to virtualised platforms
- Unified management of server and application environments
- Enhanced scalability, resilience, and performance
- Reduced operational costs and hardware dependency
- Improved user experience through Citrix and App-V delivery models

Strategic Impact

The programme delivered a modern, virtualised infrastructure that positioned Unipart for future cloud adoption and digital transformation.

By integrating Hyper-V, VMware, App-V, Citrix, and NetScaler technologies, the organisation achieved a robust, flexible, and secure foundation for enterprise operations.
